

3.0V to 5.5V, RS-232 Transceivers

Features

- Meets EIA/TIA-232-F standards
- Operates With 3-V to 5.5-V VCC Supply
- Operates up to 250 kbit/s
- Two Drivers and Two Receivers
- Low Supply Current
- External Capacitors: 4x0.1 μ F
- Accepts 5-V Logic Input With 3.3-V Supply
- 1 μ A low power shutdown with receivers active (COSMAX3222)
- Packaging:
COSMAX3232: SOP16/TSSOP16
COSMAX3222: SOP20/TSSOP20

Applications

- Battery-Powered Systems
- Hand-Held Equipment
- Laptops
- Notebooks

General Description

The COSMAX3232 and COSMAX3222 family consists of two-line drivers, two-line receivers, and a dual charge-pump circuit. The device meets the requirements of TIA/EIA-232-F and provides the electrical interface between an asynchronous communication controller and the serial-port connector. The charge pump and four small external capacitors allow operation from a single 3-V to 5.5-V supply. The devices operate at data signaling rates up to 250 kbit/s and a maximum of 30-V/ μ s driver output slew rate.

The COSMAX3222 device has a low-power shutdown mode where the devices' driver outputs and charge pumps are disabled. During shutdown, the supply current falls to less than 1 μ A. When the device is powered down, the receivers remain active while the drivers are placed in the high-impedance state. Receiver outputs also can be placed in the high impedance state by setting \overline{EN} high.

3. Application Information

3.1 Overview

The COSMAX3232 (Figure 2) and COSMAX3222 (Figure 3) are 2-driver / 2-receiver devices ideal for portable or hand-held applications. The COSMAX3222 features a $1\mu A$ shutdown mode that reduces power consumption and extends battery life in portable systems. Its receivers remain active in shutdown mode, allowing external devices such as modems to be monitored using only $1\mu A$ supply current. The charge pump and four small external capacitors allow operation from a single 3-V to 5.5-V supply. The device operates at data signaling rates up to 250 kbit/s and a maximum of $30-V/\mu s$ driver output slew rate. Outputs are protected against shorts to ground. Table 1 and Table 2 list the functional modes of the COSMAX3232 drivers and receivers.

3.2 Drivers

The COSMAX3232/COSMAX3222 drivers are inverting level transmitters that convert TTL or CMOS logic levels to 5.0V EIA/TIA-232 levels with an inverted sense relative to the input logic levels. Typically, the RS-232 output voltage swing is 5.4V with no load and 5V minimum fully loaded. The driver outputs are protected against infinite short-circuits to ground without degradation in reliability. Driver outputs will meet EIA/TIA-562 levels of $\pm 3.7V$ with supply voltages as low as 2.7V. The drivers can guarantee a data rate of 120kbps fully loaded with 3k Ω in parallel with 1000pF, ensuring compatibility with PC-to-PC communication software. The slew rate of the driver is internally limited to a maximum of 30V/ μ s in order to meet the EIA standards (EIA RS-232D 2.1.7, Paragraph 5). The transition of the loaded output from HIGH to LOW also meet the monotonicity requirements of the standard.

When the COSMAX3222 device is shut down ($\overline{\text{SHDN}} = \text{LOW}$), the device's driver outputs are disabled (tri-stated) and the charge pumps are turned off with V+ pulled down to VCC and V- pulled to GND. In the shutdown mode, the supply current falls to less than 1 μ A. The time required to exit shutdown is typically 100 μ s. Connect $\overline{\text{SHDN}}$ to VCC if the shutdown mode is not used. The driver's inputs do not have pullup resistors. Designers should connect unused inputs to VCC or GND.

3.3 Receivers

The Receivers convert EIA/TIA-232 levels to TTL or CMOS logic output levels. The COSMAX3222 receivers have an inverting tri-state output. These receiver outputs (RxOUT) are tri-stated when the enable control $\overline{EN} = \text{HIGH}$. In the shutdown mode, the receivers can be active or inactive. \overline{EN} has no effect on TxOUT. The truth table logic of the COSMAX3222 driver and receiver outputs can be found in Table 3.

Table 3 COSMAX3222 Truth Table Logic for Shutdown and Enable Control

\overline{SHDN}	\overline{EN}	TOUT1,2	ROUT1,2
0	0	Tri-state	Active
0	1	Tri-state	Tri-state
1	0	Active	Active
1	1	Active	Tri-state

Since receiver input is usually from a transmission line where long cable lengths and system interference can degrade the signal, the inputs have a typical hysteresis margin of 300mV. This ensures that the receiver is virtually immune to noisy transmission lines. Should an input be left unconnected, an internal 5kΩ pulldown resistor to ground will commit the output of the receiver to a HIGH state.

3.4 Charge Pump

The internal charge pump and four small external capacitors allow operation from a single 3-V to 5.5-V supply. Select capacitor values (Table 4) based on Vcc level for best performance.

Table 4. VCC vs Capacitor Values

VCC	C1	C2, C3, C4
3.3 V ± 0.5 V	0.1 μF	0.1 μF
5 V ± 0.5 V	0.047 μF	0.33 μF
3.0 V to 5.5 V	0.1 μF	0.47 μF
